

## NEMESIA NESSIE PLUS RED

A favorite series for strong clear color. Taller than BABYCAKES the series mainly used for large container gardening. The upgrade to NESSI PLUS assures longer season flowering.

---

## PROPAGATION

**Temperature:** The use of warm temperature propagation can rapidly encourage rooting of Nemesia. Recommended environment includes use of 68 degree F. night temperature. Misting in propagation should be used for the first 7 - 9 days to mitigate excessive wilting. Propagation environments set up with high indirect lighting will help to warm day temperature and encourage rapid rooting.

**Fertilize:** Starter fertilization can begin at 75 to 100 PPM and increase to 150 - 200 PPM at root formation.

**After root:** After root initiation, stretch in propagation can be mitigated by pinching terminal growth, move rooted cuttings to High light, lower temperature and lower humidity environment as soon as leaves can resist wilting.

**More information:** If PGRs are still needed to get controlled growth, use of B-9 at 1500 to 2500 PPM can be applied after transplant. Use PGR recommendations as general guidelines.

## FINISHING

**Environment:** Environment is critical to good Nemesia growth after transplant. At transplant, transition the rooted cuttings into Higher light (5 - 6000 foot candle) environment with cool night temperature at 60 - 62 degrees, slightly lower temperature and higher light compared to the propagation environment. Begin increased fertilization to 200 PPM.

**After rooting:** After rooting into final container, reduce irrigations and begin to dry slightly between irrigations. Temperature can again be lowered to 55 degree nights and high of 70 degree day. Product can be moved to brighter light with 8000 ft candle as a target. For 6 inch pots and larger, schedule a second pinch and encourage low branching to occur by low pinching. (Higher pinching encourages lower vegetative leaf count prior to reproductive growth.)

**More information:** Should Interveinal chlorosis be present, review pH and hold pH to 5.8 to 6.2, avoid rising pH by use of acid fertilization. In addition review irrigation practices and allow drying to occur in between irrigations. Scheduling for rooting should be 4 weeks.

## CLEAN STOCK

**CLEAN STOCK:** Susceptibility of Nemesia to viruses are well known. Kientzler Nemesia come from Kientzler Innovaplant with commitment to unsurpassed clean record of production reliability.

## CROP SCHEDULING

**Crop Scheduling:** Use the following schedules for finishing Nemesia Pots, 4 to 6 inch containers in Early spring should finish in 7 to 11 weeks, 8 and 10 inch containers 9 to 13 weeks, and Baskets 9 to 13 weeks. Later Spring finish can be reduced by 1 week.
